

WHAT IS CLAIMED IS:

- 1 1. A method for determining functional links between at least two polypeptides,
2 comprising:
 - 3 (a) aligning a primary amino acid sequence of multiple distinct non-
4 homologous polypeptides to the primary amino acid sequences of a
5 plurality of proteins;
 - 6 (b) for any alignment found between the primary amino acid sequences of all
7 of such multiple distinct non-homologous polypeptides and the primary
8 amino acid sequence of at least one such protein, outputting an indication
9 identifying the at least one such protein as an indication of a functional
10 link between the multiple polypeptides;
 - 11 (c) obtaining data, comprising a list of polypeptides from at least two
12 genomes;
 - 13 (d) comparing the list of polypeptides from at least two genomes to form a
14 protein phylogenetic profile for each protein, wherein the protein
15 phylogenetic profile indicates the presence or absence of a polypeptide
16 belonging to a particular protein family in each of the at least two
17 genomes based on homology of the polypeptides; and
 - 18 (e) grouping the list of polypeptides from a particular protein family based on
19 similar profiles, wherein a similar profile is indicative of a functional link
20 between the polypeptides;
 - 21 (f) comparing the functional links identified in step (b) and step (e) or both to
22 functional links identified by patterns of correlated expression,
23 experimentally measured interactions, and functional relationships.
- 1 2. The method of claim 1, further comprising, displaying the functional links as
2 networks of related proteins comprising:
 - 3 (g) placing all polypeptides in a diagram such that functionally linked proteins
4 are closer together than all other proteins; and
 - 5 (h) identifying proteins that fall in a cluster in said diagram as a functionally
6 related group.
